Chapter 1: Interpreting genome-wide expression profiles -A knowledge-based approach

Introduction

Genes typically operate in a sophisticated network of interactions and it is now well recognized that co-expressing genes tend to be playing some common roles in the cell. Recent evidences also suggest functionally related genes map close even in the eukaryotic genomes. Complex phenotypic traits, including diseases are now considered from a systems

biology perspective. Thus, there is a clear necessity for methods and tools which can help to understand genome-scale experiments (for e.g. microarray-based gene expression) from a systems biology perspective. Genome-wide expression analysis with DNA microarrays has become a mainstay of genomics research. In fact, the challenge no longer lies in obtaining gene expression profiles, but rather in interpreting the results to gain insights into biological mechanisms (Subramanian et al., PNAS, 102: 15545-15550). A typical experiment generates

mRNA expression profiles for thousands of genes from a collection of samples belonging to different classes. The genes are ordered in a ranked list based on their differential expression between the classes. The proper interpretation of this data requires an integrative systems biology-based functional annotation wherein the collective properties of groups of genes are taken into account rather than individual genes. The principal challenge then is to extract meaning from this list(s) – what is the common or unifying theme(s)?

- a. Common Regulation (shared cis regulatory elements or transcription factor binding sites)
- b. Common Biological Function (common pathways or processes)
- c. Chromosomal Location

Chapter 2: Strategies for Identifying Putative Gene Regulatory Regions in a Group of Genes

Objectives

- i. Fetch the promoter sequences from a group of coexpressed genes
- ii. Identify the common/shared transcription factor binding sites (TFBSs) or *cis*elements for this group of promoters
 - a. Known
 - 1. Non-conserved
 - 2. Conserved
 - b. Unknown/Novel
 - 1. Non-conserved
 - 2. Conserved

Fetching the Promoter Sequence

- 1. Go to the UCSC genome browser home page ((http://genome.ucsc.edu) and get the sequence for
 - a. Single gene:
 - i. Using gene symbols:
 - From the home page i.e. http://genome.ucsc.edu, click on the "Genomes" link (top navigation bar - left hand corner). Once you are on the Genome Browser Gateway page, select whichever genome you are interested in. In the box under "position or search term" enter the gene symbol and click submit.
 - The following pages list your query results under different categories (e.g. Known Genes, RefSeq Genes, etc.). What this means that your query has results from these different tables or databases.
 - Click on the entries below RefSeq Genes (wherever available; RefSeq or Reference Sequence is a database of curated mRNAs from NCBI) and this will take you to the Genome Browser page.
 - Click on the "DNA" (navigation bar on the top)
 - On the "Get DNA in Window" page, enter your sequence retrieval region options (for e.g. how many base pair upstream, etc.)
 - If you want to mask the repeat regions, check that option under "Sequence Formatting Options"
 - Finally click on "get DNA" to get the sequence in fasta format.
 - Explore the "extended case/color options"
 - ii. Using accession numbers
 - Same as above but using accession number instead of gene symbols.

	SC Gen Brows	er was ded by th	e <u>Genome Bi</u> e University alifornia. All rights	UC Sant 5 ruz.

- b. Group of genes:
 - i. Using gene symbols
 - Fetching upstream 1 kb sequences for a list of genes using gene symbols Use "RefFlat" option.
 - Human genes: Gene symbols should be in upper case and they should be approved gene symbols (for e.g. TP53 instead of p53 although p53 is commonly used, the approved gene symbol is TP53)
 - Mouse genes: Gene symbols should be lower case (the first letter should be upper case). For e.g. Trp53 for mouse p53.
 Note: the mouse orthologous gene for human TP53 gene is not Tp53 but Trp53!
 - Where can I get a list of human and mouse approved symbols and the orthologous pairs?
 - NCBI's Homologene (http://www.ncbi.nlm.nih.gov/sites/entrez?db=homolog ene)
 - MGI's ortholog table (ftp://ftp.informatics.jax.org/pub/reports/index.html)
 - ii. Using accession numbers
 - Same as above but with **two** differences:
 - Use RefSeq accession numbers (start with NM_XXXXXX
 - Use the option "RefGene" instead of "RefFlat"

- 2. Advanced: What if you want to download upstream 1 kb plus 200 bp downstream of the transcription start site? It can be done but you need to get the start positions of all your genes of interest and then (using excel) start subtracting 1000 from the start and also start adding 200. Thus, you will get a new start and end and you can use these to fetch the genomic sequences of desired length.
- 3. Advanced: How can I get a list of all SNPs occurring in the upstream 1 kb regions of genes of my interest?
 - a. To do this you first need the coordinates or positions of the upstream regions (1 kb regions' start and end positions) (see 2 above)
 - b. Then using these coordinates or regions as the base you can intersect with other features (for e.g. get me all SNPs that intersect or fall within these selected regions. Use the "intersection" feature from the table browser options.

4. LIMITATIONS:

- a. Transcription Start Sites (TSS) are still not well defined. Surprisingly the experimentally validated promoters for human and mouse are only about 1870 and 200 respectively! The Eukaryotic Promoter Database (EPD) is an annotated non-redundant collection of eukaryotic POL II promoters, for which the transcription start site has been determined experimentally. EPD can be accessed at http://www.epd.isb-sib.ch/. For all practical purposes, we consider the region upstream to the NCBI's RefSeq mRNAs (http://www.ncbi.nlm.nih.gov/RefSeq/) as putative promoters. There is no single, perfect TSS or promoter prediction algorithms. Of the available ones, the firstEF (first exon finder; http://rulai.cshl.edu/tools/FirstEF/) does a reasonably good job (tested using experimentally validated promoters).
- b. Regulatory regions (especially enhancers and silencers) can occur just anywhere (intronic, downstream, farther upstream, UTRs).
- c. Regulatory mechanisms other than transcriptional: Posttranscriptional (e.g. miRNAs), posttranslational (protein modifications) or epigenetic mechanisms (differential effects of chromosome or chromatin packaging rather than by differences in DNA sequence).

# Identification of Putative Common/Shared Cis-Elements

Known

Non-conserved

#### <u>GEMS Launcher (Genomatix) Search for common TF sites in multiple sequences</u> URL: http://www.genomatix.de

Access: Licensed software (free for 20 analyses per month).

**Description/Utility**: You can search for transcription factor binding sites (TFBS) that are common to all or a subset of your input sequences. The results are displayed graphically. You can enter the percentage of sequences that have to contain the common sites. The search is based on known TFBSs that are stored as position weight matrices (PWMs) in the library.

Input: Fasta sequences (max 100 sequences) or any other format.

Output: Graphical and tab-delimited/spreadsheets

**Other Comments**: Genomatix has several other useful applications/tools that help to understand the molecular mechanisms of gene regulation as a central part of systems biology. The MatInspector tool of Genomatix is one of the widely used tools to identify potential binding sites in a DNA sequence.

#### Conserved

CisMols

#### URL: http://cismols.cchmc.org

Access: Free; Web-based

**Description/Utility**: Filtering candidate transcription factor binding site clusters (cisregulatory element clusters) based on sequence conservation is helpful for an individual ortholog gene pair, but combining data from cis-conservation and coordinate expression across multiple genes is a more difficult problem. To approach this, we have extended an ortholog gene pair database with additional analytical architecture to allow for the analysis and identification of maximal numbers of compositionally similar and phylogenetically conserved cis-regulatory element clusters from a list of user-selected genes. Starting with identification of cis-clusters in phylogenetic footprints, we intend to extend the query to identify compositionally similar cis regulatory element clusters that occur in groups of co-regulated genes within each of their ortholog-pair evolutionarily conserved cis-regulatory regions. These computationally predicted cis-clusters, which we call as cismols, could serve as valuable probes for genome wide identification of regulatory regions and novel gene targets.

Support: Please refer to the "Help" section

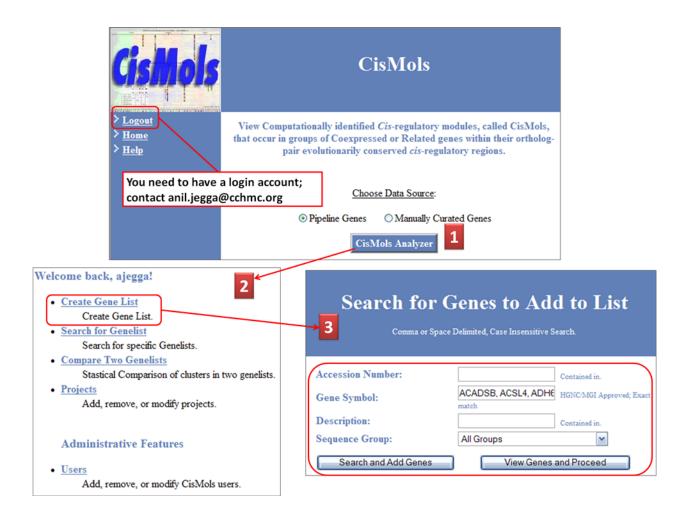

(http://info.cchmc.org/help/cismols/index.html) on CisMols home page (http://cismols.cchmc.org). For accounts, any problems or questions or analysis, send a

mail to anil.jegga@cchmc.org.

**Input**: Human or mouse gene symbols or RefSeq accession numbers (hint: start with NM_).

**Output**: Graphical output (can be stored as pdf or any other image formats). Data can be downloaded in a spreadsheet.

#### **DiRE (Distant Regulatory Elements of co-regulated genes)**

URL: http://dire.dcode.org

Access: Free; Web-based

**Description/Utility**: DiRE uses gene co-expression data, comparative genomics, and combinatorics of transcription factor binding sites (TFBSs) to find TFBS-association signatures that can be used for discriminating specific regulatory functions. DiRE's unique feature is the detection of REs outside of proximal promoter regions, as it takes advantage of the full gene locus to conduct the search. DiRE can predict common REs for any set of input genes for which the user has prior knowledge of co-expression, co-function, or other biologically meaningful grouping.

**Input**: Human or mouse or rat gene symbols or RefSeq accession numbers or chromosomal location.

**Output**: Graphical output and table.

Distant Regulatory Elements of co-regulations of	http://dire.doode.c
	nents now. It is also possible to run DiRE on human (hg18), mouse (mm9 rn4) genomes.

#### oPOSSUM (Distant Regulatory Elements of co-regulated genes)

# URL: http://burgundy.cmmt.ubc.ca/oPOSSUM/

#### Access: Free; Web-based

**Description/Utility**: oPOSSUM is a system for determing the over-representation of transcription factor binding sites (TFBS) within a set of (co-expressed) genes as compared with a pre-compiled background set. The input is a set of gene identifiers. Analysis parameters are chosen. The system then compares the number of hits for each selected TFBS in the target gene set against the background set. Two different measures of statistical significance are applied to determine which sites are over-represented in the target set. The results of the analysis are displayed in tabular form.

**Input**: Human or mouse gene symbols or RefSeq accession numbers or Ensembl ID, or Entrez Gene IDs.

#### Output: Tab-delimited file.

Select Analysis Parameters
STEP 1: Enter a list of co-expressed genes
Species: • human O mouse
Gene ID type: O Ensembl ③ HUGO/MGI Symbol/Alias O RefSeq O Entrez Gene
Paste gene IDs:     Use sample genes     Clear
SLC38A4
SLC01B3
TM4SF4
UGT2B28
UGT2B4
OR upload a file containing a list of gene identifiers: Browse

STEP 3: Select parameters
Level of conservation: Top 10% of conserved regions (min. conservation 70%)
Matrix match threshold:
Amount of upstream / downstream sequence:
Number of results to display: <ul> <li>Top 10 v results</li> <li>OR only results with Z-score &gt;= 10 v and Fisher score &lt;= 0.01 v (Default values have been chosen based on empirical studies)</li> </ul>
Sort results by: O Z-score ④ Fisher score
Press the <b>Submit</b> button to perform the analysis or <b>Reset</b> to reset the analysis parameters to their default values. Depending on server load Submit Reset

#### Analysis Results

Selected Parameters

Conservation level:	Top 10% of conserved regions (min. conservation 70%)
Matrix match score:	80%
Upstream sequence length:	2000
Dwwnstream sequence length:	2000
Number of genes submitted:	26
Number of genes included:	21
Number of genes excluded:	5

#### Non-conserved

#### MEME – Multiple Em for Motif Elicitation

#### URL: http://meme.sdsc.edu/meme/meme.html

Access: Free; Web-based; The web-based version has limit of number of base pairs (should not be more than 60,000 bp). Alternately, you can download the software and install it on your own computer. This will allow you to use many features that are not available with the interactive version.

**Description/Utility**: MEME is a tool for discovering motifs in a group of related DNA or protein sequences. A motif is defined as a sequence pattern that occurs repeatedly in a group of related protein or DNA sequences. MEME represents motifs as position-dependent letter-probability matrices which describe the probability of each possible letter at each position in the pattern. Individual MEME motifs do not contain gaps. Patterns with variable-length gaps are split by MEME into two or more separate motifs.

MEME takes as input a group of DNA or protein sequences (the training set) and outputs as many motifs as requested. MEME uses statistical modeling techniques to automatically choose the best width, number of occurrences, and description for each motif.

MEME sends you three e-mail messages:

• a confirmation message,

- the MEME results, and
- the MAST results of searching the training set for the motifs found by MEME using MAST.

One of the features of MEME that come handy is it facilitates you to compare the identified motifs to known TFBSs. This will help you to find out potentially "real" novel motifs in the sequences of coexpressed genes.

**Input**: Multi-fasta files (not more than 60,000 bp)

**Output**: There is no good way of using/storing the graphical output (especially if you want to use it in a presentation or publication) except for taking a screen capture.

#### **Drawbacks/Limitations**:

- Larger sequences can take considerable amount of time (more than a day). Explore the mirror sites OR download the application and use it locally.
- Results can be difficult to interpret.
- Always try to mask the repeat elements otherwise your top scored motifs could be repeat elements!

Version 3.5.4	Use this form to submit DNA or protein sequences to MEME. MEME will analyze your sequences for similarities among them and produce a description (motif) for each pattern it discovers. Your results will be sent to you by e-mail.
Required	1
Your e-mail address: an il.jegga@cchmc.org Re-enter e-mail address: an il.jegga@cchmc.org Please enter the sequences which you believe share one or more motifs. The sequences may contain no more than 60,000 characters total in any of a large number of formats. #### Weeder

Similar to MEME but comparative studies have shown it be better than MEME (speed, output, results, robustness)

Drawbacks/Limitations: Results are sent in the mail message. Some email clients (e.g. Groupwise mail) truncate longer messages and therefore you may not see complete results (especially if you are using several sequences). I use Gmail and that works fine.

Iver and the set of th	Weeder         Motif discovery in sequences from co-regulated genes         Version 1.3.1 running:         Click here to switch to WeederH         Please note: submitting simultaneously a large (> 10) number of jobs has the effect of slowing down the server, for your jobs, as well as the jobs submitted by other users. #### Conserved

Currently, there are no publicly available tools that can look for conserved motifs across multiple sequences. You can use MEME or Weeder by using orthologous promoters. But this can sometimes lead to erroneous results (for e.g. the high scoring motifs can be the same ones just coming from ortholog copy of the same gene).

In case anyone needs assistance in this type of analysis (for e.g. a genome-wide scan for two or multispecies conserved motifs), we can assist (the tool/application we are working on is in development stage).

# Chapter 3: Functional Enrichment Analysis of the Transcriptome

# Objectives

- 1. What is the functional enrichment for a given set of genes
  - a. Gene Ontology (Biological Process, Molecular Function and Cellular Component)
  - b. Pathways (Kegg, Biocarta, etc.)
  - c. Protein Domains (Interpro, PFAM, etc.)
  - d. Functional Keywords (SwissProt keywords genes associated with controlled vocabulary terms e.g. all genes associated with the word "apoptosis")
- 2. What is the expression pattern of these genes in other conditions (or how do my genes score in other microarray expression experiments)
- 3. How to prioritize/rank the genes in my gene list so that I can select a handful for further experimental validation

# Introduction

The pathway, ontology data sources and analysis tools establish a basis for finding links between lists of genes in their associated biological network context. Several tools/servers are available that effectively utilize these various resources and help in understanding of the unifying biological themes underlying one's data. Here I list some of the "popular" and useful ones. **My favorites** are:

- 1. For single gene list enrichment analysis: DAVID, MSigDB, FatiGO+ and Panther (not necessarily in that order)
- 2. For comparison:
  - a. Two gene lists: FatiGO+ (extensive parameter coverage including miRNAs!)
  - b. Multiple gene lists: Panther (but the parameters are limited)
- 3. For comparison of a gene list with other published gene sets based on different experiments: L2L and MSigDB (for cancer related datasets Oncomine is probably the best)
- 4. For both enrichment analysis and also candidate gene prioritization: ToppGene. It's probably the only one database currently that takes into account literature co-citations and also mouse phenotype data for functional enrichment analysis.

# **Tools and Servers**

## DAVID

**Description**: Database for Annotation, Visualization and Integrated Discovery (DAVID) provides a comprehensive set of functional annotation tools for investigators to understand biological meaning behind large list of genes.

## **MSigDB** (Molecular Signatures Database)

**Description**: The "annotation" features helps you to compute overlaps between your gene set and other gene sets in MSigDB. Additionally, you can also categorize members of the gene set by gene families and display the gene set expression profile based on a selected compendium of expression profiles. The analysis results include: *Statistics*:

- overlaps shown lists the number of overlapping gene sets displayed in the report: By default, the report displays the 10 gene sets in the collection that best overlap with your gene set. If you compute overlaps from the Annotations page, you can choose the number of overlapping gene sets to display in the report.
- gene sets in collection lists the total number of gene sets being analyzed
- genes in comparison lists the number of genes in your gene set
- genes in collection lists the number of unique genes in the gene sets being analyzed

#### Descriptions of the overlapping gene sets, including

- Link to the gene set card
- Number of genes in the gene set
- Description of the gene set
- Number of genes in the overlap between this gene set and your gene set
- *p value* indicating the significance of the overlap
- Color bar shading from light green to black, where <u>lighter colors indicate more</u> significant p values (< 0.05) and black indicates less significant p values ( $\geq 0.05$ ).

#### Overlap matrix showing the genes in the overlapping gene sets

- Rows list the genes in your gene set, with gene descriptions and links to gene annotations
- Columns list the overlapping gene sets, with links to the gene set cards
- Overlaps are computed using HUGO gene symbols. In rare instances, a gene set may contain a gene symbol that is not in the GENE_SYMBOL chip annotation file. Such gene symbols are ignored when overlaps are computed and appear crossed out in the matrix. If a gene set has a source platform other than GENE_SYMBOL, each gene symbol in the gene set is translated to its probe identifier(s) on the source platform. The matrix lists the probe identifier(s) in parentheses following the gene symbol. If a gene symbol cannot be translated, a question mark (?) appears in place of the probe identifier(s).

# Panther

**Description**: The PANTHER (Protein ANalysis THrough Evolutionary Relationships) Classification System is a unique resource that classifies genes by their functions, using published scientific experimental evidence and evolutionary relationships to predict function even in the absence of direct experimental evidence. Proteins are classified by expert biologists into families and subfamilies of shared function, which are then categorized by molecular function and biological process ontology terms. For an increasing number of proteins, detailed biochemical interactions in canonical pathways are captured and can be viewed interactively.

URL: http://www.pantherdb.org

Access: Free web-based. By registering, you can store you gene lists and results ("workspace").

Compare Classifications of Lists ⑦ Map lists of genes to a PANTHER ontology.For pathways, you can then view the gene expression values overlaid on top of a pathway diagram, where genes will be colored differently for different clusters of genes.

Use the binomial statistics tool to compare classifications of multiple clusters of lists to a reference list to statistically determine over- or under- representation of PANTHER classification categories. Each list is compared to the reference list using the binomial test (<u>Cho & Campbell, TIGs 2000</u>) for each molecular function, biological process, or pathway term in PANTHER.

Steps: 1. Select list(s) to analyze > 2. Select reference list	<ul> <li>1. Select Lists to Compare to a Reference List For example, each selected list may be a cluster of co-expressed genes under a particular set of conditions. Select list(s) selected: FetalLiverSpecific.txt AdultHeartSpecific.txt AdultHeartSpecific.txt  For example, the reference list may be the set of all genes in the experiment, or the set of all genes in the genome being analyzed. #### L2L

**Description**: L2L is a database of published microarray gene expression data, and a software tool for comparing the published data to a user's own microarray results. **URL**: http://depts.washington.edu/l2l/

# ToppGene

**Description**: The majority of common diseases are multi-factorial and modified by genetically and mechanistically complex polygenic interactions and environmental factors. High-throughput genome-wide studies like linkage analysis and gene expression profiling, tend to be most useful for classification and characterization but do not provide sufficient information to identify or prioritize specific disease causal genes. Hypothesizing that the majority of genes that impact or cause disease share membership in any of several functional relationships ToppGene integrates several data sources for disease candidate gene prioritization. ToppGene for the first times uses mouse phenotype data as one of the features for gene prioritization and we have observed that using mouse phenotype data greatly improves the human disease candidate gene analysis and prioritization

URL: http://toppgene.cchmc.org

Access: Free, web-based

**Utility**: Can be used for both functional enrichment in gene lists and also to prioritize candidate genes.

**Input**: Human gene symbols or gene IDs (NCBI's Entrez gene IDs) **Output**: Graphical and results are downloadable as tab-delimited text files.

Limitations: Currently works only for human genes.

#### **Babelomics (FatioGO)**

**Description**: In addition to GO terms it can test simultaneously for KEGG pathways, Interpro motifs, SwissProt keywords, TFBSs and CisRed motifs. The distribution of any combination (or all) of the terms between two groups of genes can be simultaneously tested by means of a Fisher exact test. All the P-values are adjusted by FDR.

BABELOMICS. New Release v3.1!  Gene list profiling with new remasterized option 'Fatigo Search'. Enrichment and filtering of "your annotation" db over present Gene Ontology terms. Improved projects and jobs management. Improved user attendance via troubleshooting form and faq list.	GHS BHELOMO BIR
<ul> <li>BABELOMICS v3.1 also contains</li> <li>Functional profiling by functional enrichment methods (FatiGO) and gene set methods.</li> <li>Many functional and regulatory definitions (GO, KEGG, Biocata, text-mining derived bioentities, Transfac, CisRed, miRNAs, etc.) and importation of user-defined gene-term definitions.</li> <li>Wide coverage of model organisms (Homo sapiens, Mus musculus, Rattus norvegicus and Saccharomyces cerevisiae, Anopheles gambiae, Drosophila melanogaster, Gallus gallus, Bos taurus, Caenorhabditis elegans, Danio rerio)</li> <li>Tools for automatic functional annotation of unknown sequences (Blast2GO) integrated.</li> </ul>	R. Bar

	FatiGO
	Functional enrichment
	Fatigo performs functional enrichment analysis by comparing two lists of genes by means of a Fisher's exact test. Gene modules used in the test are defined in different ways which include functional criteria (GO, KEGG, Biocarta, etc.) regulatory criteria (transcription factor targets, miRNA, etc.) and chromosomal location. Also user-defined gene modules can be imported and used for functional enrichment.

		FatiScan Gene set enrichment
	Unique ir study o differer survival. M	implements a segmentation test which checks for asymmetrical distributions of biological labels associated to genes ranked in a list (Al-Shahrour et al., 2005a,b). this type of approaches, this test only needs the list of ordered genes and not the original data which generated the sorting. This means that can be applied to the the relationship of biological labels to any type of experiment whose outcome is an sorted list of genes. Since Babelomics is linked to GEPAS, genes sorted by tid lacynession between two experimental conditions can be studied, but also genes correlated to a clinical variable (such as the level of ametabolite) or even to oreover, other lists of genes ranked by any other experimental or theoretical criteria can be studied, but and parameters, etc.) in order to understand whether there is some biological feature (among the labels used) which is related to the experimental parameter studied.

#### **OntoExpress**

**Description**: OntoExpress constructs functional profiles (using Gene Ontology terms) for the following categories: biochemical function, biological process, cellular role, cellular component, molecular function and chromosome location. Statistical significance values are calculated for each category (Draghici et.al, Genomics, 81(2), 2003). **URL**: http://vortex.cs.wayne.edu/projects.htm

Pathway-Express			
The automated functional profil	ing approach of OE helps the	researchers to better understand	the biological

The automated functional profiling approach of OE helps the researchers to better understand the biological phenomenon under study by pointing out statistically significant cellular functions. However, graphical representations of gene interactions (pathways) can be very useful As more data becomes available, the question ?is there a known pathway containing my gene(s) of interest?? will gradually transform into ?how do I find the most interesting pathway(s) involving my gene(s)??

Pathway-Express (PE) is a new tool in the Onto-Tools ensemble that is designed to answer such questions. Our goal is to provide a system that will automatically find such interesting pathways. When the user submits a list of genes, the system performs a search and builds a list of all associated pathways.

## Chapter 4: Identification of Regulatory Regions: Using Trafac and Other Related Tools

Before going any further, please check the **GenomeTrafac** database (http://genometrafac.cchmc.org) which has more than 12,000 human-mouse gene pairs and about 200 microRNAs already analysed for potential regulatory regions. The genes or microRNAs you are interested in might be already there. This will save you the trouble of uploading them through trafac. You DON'T need any account to access the database.

## Introduction

Trafac (http://trafac.cchmc.org) is a web-accessible system, developed by us at Biomedical Informatics, to detect and visualize constitutionally similar clusters of transcription factor binding sites between a pair of genes.

#### Method

We first identify regions of genomic sequence conservation between two related but yet divergent species. Potential transcription factor binding sites, based on the TRANSFAC Professional Library, are independently predicted for both the genomic sequences. A JAVA servlet is then used to parse the results of this sequence conservation and transcription factor binding sites (*cis*-elements) data into an Oracle database. The database is mined for the detection of clusters of *cis*-elements in common between the two genes.

#### Output

- 1. **Trafacgram**: A high-resolution graphical image depicting the relative structural arrangement of the shared transcription factor (TF) binding sites within each sequence.
- 2. **Regulogram**: To better understand the occurrence of conserved *cis*-element clusters as a function of entire genomic regions, rather than discrete homologous blocks, we developed a *cis*-element hit-density graph (Regulogram) that depicts the density of shared *cis*-elements occurring within a moving window through conserved regions.

## Utility

- 1. To find conserved TF binding sites between two orthologous genes in the context of sequence similarity.
- 2. It can be a valuable filtration tool for identifying potential novel regulatory regions, hitherto unknown.
- 3. It helps in comparison of heterologous genes (for e.g. two genes with similar expression).
- 4. It helps in identifying shared TF binding sites within genes that exhibit coordinate expression.
- 5. Finally, it also helps in understanding the constitution of regulatory regions of tissue specific genes.

#### What do you need?

- 1. Genomic Sequences: Exons, Introns, upstream and downstream regions.
- 2. Exon coordinates or positions in the genomic sequence.
- 3. Masking the repeats.
- 4. List of transcription factor binding sites.
- 5. Sequence alignment data where applicable.

#### How to Use Trafac?

From the home page of Trafac you can approach to the analysis by taking either of the two routes.

- 1. <u>Cis-element Clusters within BlastZ Alignments</u>: To Find conserved cis-clusters within BLASTZ-identified conserved sequence alignment blocks. Using this link you would be able to visualize the alignment between an orthologous pair of genes (mostly human and mouse sequences). Most importantly, you can view the common putative TF binding sites shared by the human and mouse genes in the context of the conserved regions. This utility is limited to a pairwise comparison of <u>only those</u> <u>sequences for which the alignment data is present in the database</u>. But, then if you are interested in a particular gene(s) you can upload the requisite input data to visualize the results. Alternatively, you can send us the sequences and we will do the rest for you.
- 2. <u>Cis-elements Shared Between any Gene Pair</u>: To Find cis-element clusters between user-selected gene segment pairs. This link would take you to explore the genes for regulatory elements irrespective of the sequence similarity. The main advantage of this route is you can compare any gene with any other gene or known promoters/enhancers in the Trafac database. If you are analyzing a group of co-expressed or coordinately regulated genes, this approach is recommended, especially when you know the transcription start site.

You can search the trafac database either by the

- Accession number: A GenBank or Celera accession number can be used.
- Name/Symbol of the gene: Trafac supports the gene nomenclature approved by the HUGO.
- Description/any term: Enter any term, for example, human, mouse, repair, etc. Please make sure to enter only one term.

**Sequence Group**: You can also select the genes based upon the gene group. For example, selecting "DNA repair" from the list of the available groups would display all genes belonging to DNA repair group and which have the BlastZ alignment data entered to Trafac. *Please note that the list of genes under each of the groups at present is not exhaustive*. We are in the process of building up the database and adding more genes and more groups. If you are interested in any particular gene or group please let us know so that we can add them to the Trafac database.

**Sequence Selector**: Sequence selector page has two parts. The top one is the query part wherein you can enter one or more than one search criteria. The second part or the lower half displays your search results once you click on the search.

#### Using Sequence Selector for identifying potential conserved regulatory regions:

- 1. Enter one or more than one search criteria and click the Search button. Alternatively you can choose one from the existing groups of genes.
- 2. The results will be displayed in the lower half.
- 3. For example, using the term "Human" for description displays a list of entries in the lower half.
- 4. The results table has check boxes in the first column against each entry. You can check one or more to view the sequences.
- 5. Check your selected entries and click on Select. This would take you to the BlastZ alignments page. The first two columns of the table show the sequence information for the human and mouse sequences followed by a date of entry column. The last column shows three options. The **view** option would take you to the Local alignments page. This is nothing but a summary view of the sequence alignment information. The second option "**PIP**" leads to a graphic display of the alignment image. This PIP is generated using the PipMaker software. This is a pdf file so you need to have an Adobe Acrobat Reader installed to view this. The third option is the "**Regulogram**", a cis-element hit density graph in the context of sequence similarity.

#### Using Sequence Selector for identifying constitutionally similar regulatory sites:

- 1. Enter one or more than one search criteria and click the Search button. Alternatively you can choose one from the existing groups of genes
- 2. The results will be displayed in the lower half.
- 3. For example, using the term "Human" for description displays a list of entries in the lower half.
- 4. The results table has check boxes in the first column against each entry. You can check the first sequence and click. You will be prompted to select the second sequence. After selecting both the sequences, you will be led to the TraFaC query Page.
- 5. The **TraFaC Query Page** allows the user to alter the various parameters like sequence extent, matrices, image size, comparison parameters, whether based on matrix families or individual matrices, etc.

## **Uploading Sequences:**

If you wish to upload the genes of your interest and those which are not already present in TraFac database, you need to have an account. You can obtain one by sending a mail (anil.jegga@chmcc.org or bhuvana.sakthivel@cchmc.org). If you have only one or two genes to be analyzed, you can mail us the sequences or GenBank accession number(s) or gene symbols and we can upload the genes for you.

#### Multi-Upload Page

From the Multi-Upload page, you can parse all the input files to the TraFac server and see the results. There are certain rules you need to follow when uploading the input files.

- All the input files should be strictly in the recommended format (in text format for all except the MatInspector files and the PIP, which are in html format and pdf respectively).
- An accession number should always be entered whenever you are uploading any of the files except MatInspector files.
- The exon file, repeat mask and the actual sequence file upload is optional. However, we advise you to upload all of these so that you can comprehend your results more clearly.

The requisite input files can be uploaded from your local system using the browse button. Click the upload button when you are through. Uploading may take some time depending upon your sequence size. You can upload any of these data in parts but do remember to associate with a unique ID, which is the accession number. An "upload successful" message indicates that you are ready to view your results.

## **Input Files**

- a. Sequence Files
- b. Exon Files
- c. RepeatMasker Output Files
- d. PipMaker Output Files
- e. MatInspector/Match Output Files
  - 1. Sequence Files: The nucleotide sequence files need to be in the fasta format.
  - 2. RepeatMasker: The RepeatMasker web application is used to mask the repeats before aligning them. Given below are the brief instructions for using the RepeatMasker. You can find a detailed set on the RepeatMasker page. Use the 'browse' button to select the fasta file created above, or copy the fasta sequence into the text box. Select the "html" return format, the appropriate DNA Source and press Submit Sequence. Save the Matches as a text file to your computer by selecting File->Save As... from the main menu. You can use copy and paste to save the Repeat Mask output. The mask output alone is required. Do not save the masked sequence.
  - 3. Exon Files: An optional text file, providing the positions of transcriptional units in the first sequence. The directionality of a gene (< or >), its start and end positions, and name should be on one line, followed by separate lines specifying the start-positions and end-positions of each exon. An optional line beginning with a "+" character can indicate the first and last nucleotides of the translated region (including the initiation codon, Met, and the stop codon). Blank lines are ignored. Exons must be specified in order of increasing address even if the gene is on the reverse strand (<). For example, the Exons file might begin as follows:

> 100 800 Gene 1 100 200 300 400 600 800

4. **PipMaker Output Files**: PipMaker computes alignments of similar regions in two DNA sequences. The resulting alignments are summarized with a Percent Identity Plot (PIP). It generates graphical output as a PDF document by default. For TraFaC,

you need the **Blastz alignment file**, the **summary file** and an optional **PIP** file. These are referred as "**text**", "**concise**" and "**pip**" files respectively in the PipMaker output data, which you receive by an E-mail. We give here the brief instructions for using the Advanced PipMaker. For detailed instructions refer the advanced PipMaker instructions page. Follow the Advanced PipMaker instructions (the files you have created above can be used). Enter your E-mail address. Press the Submit button. When the alignment is finished, you will receive an E-mail containing multiple attachments. Of the different output files **Trafac** needs only three of them *viz.*, *Concise Alignment file*: This file has a summary of the sequence alignment information. *Text file*: This is a verbose file and is actually a BLASTZ alignment file. *PIP*: a .pdf file of the percent identity plot. Store the first two files as text files.

5. **MatInspector** *Professional/***Match Output Files**: You can use either of these programs for detection of transcription factor binding sites. MatInspector professional or Match is a tool that utilizes a library of matrix descriptions for transcription factor binding sites to locate matches in sequences of unlimited length. To access both these programs you need to have registered with them and it is free. You can find the detailed instructions on these pages. We however, would like to highlight some of the points like:Be certain to choose the appropriate matrix family e.g. vertebrates. And follow the default options for the rest of the parameters. When you have the output, save the MatInspector files as html files. But in case of Match files, save them as text files.

Once you have all of the requisite files, log on to Trafac. From Advanced Tools, select Upload/Parse Sequence Data.

## **Related Tools**

**Concise Scanner** (Conserved Cis-Element Scanner; http://concise-scanner.cchmc.org): Concise Scanner was developed primarily as an answer to the question as to what are the potential additional target genes for an identified regulatory module(s). Tools based on the phlyogenetic footprinting like TraFaC (and GenomeTraFaC, the human-mouse gene regulatory region repository created using TraFaC server), and others while helping in identification of potential regulatory regions provide little or no information as to through what genes the transcription factors (TFs) exert their function in the living system. Providing a complement to the above listed phylogenetic approaches, we developed Concise (Conserved Cis Element) Scanner that undertakes a more targeted search, finding phylogenetically conserved regulatory targets of defined transcription factors whose DNA binding site specificity is known. It identifies potential targets of one or more clusters of transcription factors with a defined cis-regulatory target specificity, using human and mouse genomes. It enables you to select one or more transcription binding sites and search all genes in the GenomeTrafac database for clusters containing the selected site(s). Within each cluster, you can view the exact position of each binding site.

## Chapter 5: Annotation of Coding Single Nucleotide Polymorphisms: Using PolyDoms

**Description**: There is a wide gap between the growing number of reported nsSNPs in human population and the functional consequences of these nsSNPs, and the major challenge lies in distinguishing the functionally significant and potentially disease-related ones from the rest. PolyDoms is based on the hypothesis that if an nsSNP alters the ability of gene products to function normally within the biological pathways or processes, the consequences might either alter disease susceptibility or resistance or result in disease itself or affect the therapeutic regimen. We mapped the coding SNPs (synonymous and non-synonymous) of all the proteins onto their know protein 3D structure and functional domains. We used the coding SNP data from the dbSNP. The database supplemented with a variety of functional implication prediction algorithms like SIFT, PolyPhen, LS-SNP, etc. The web interface supports a variety of queries (GO terms, disease terms, gene families, etc.). Please refer to the "Help" section (http://info.chmcc.org/help/polydoms/index.html) on PolyDoms home page (http://polydoms.cchmc.org). For any problems or questions or analysis, send a mail to anil.jegga@cchmc.org

Access: Free web-based

**Input**: Gene symbols, accession numbers, rsSNP IDs, disease terms, GO Terms, etc. **Output**: Graphical and results are downloadable as a spreadsheet.

# EXERCISE: Transcriptome Analysis and Annotation

1. Using the following two gene lists, identify conserved and non-conserved common binding sites within the upstream 500 bp (Hint: when downloading the promoter sequences use 500 bp) Gene List 1: ADORA1 AGTRAP **CD37** COL3A1 COL4A2 COL6A1 COL6A3 DCN E2F4 FN1 LOC374395 LOXL1 LRP3 LRP5 LUM MMP9 NUMA1 PPARBP **PPARD** PPP2R1A PSG9 PTGDS **PTPRN** ROM1 SNN **SPARC** THBS2 Gene List 2: APAF1 BAD BAX BCL2 BID BIRC2 **BNIP3L** CASP1 CASP2 CHUK

CYCS

DFFA DFFB FADD FAS MDM2 MYC NFKB1 NFKBIA PRF1 RELA RIPK1 TNF TNFRSF10B **TP53 TP73** TRAF1

- 2. UCSC Browser related:
  - a. Find genes that are predominately expressed in the mouse pancreas, determine the expression pattern of the human ortholog of one such gene and obtain the genomic sequence of the human gene.
  - b. Obtain a list of SNPs in a single gene (*PLG*) using the UCSC Table Browser and annotate them using NCBI's dbSNP batch processor.
  - c. Using one of the gene lists from (1) download all noncoding SNPs occurring within upstream 1 kb region
  - d. Using the same gene list download all coding SNPs. How many of these SNPs are predicted to be deleterious (*Hint*: use PolyDoms once you obtain the list of SNPs. *Alternate approach*: You can directly use the gene symbols and download the annotated cSNPs including putative deleterious ones from PolyDoms)
- 3. Using the gene lists (based on published microarray data; Appendix 2), and the applications CisMols, GenomeTrafac and ConciseScanner:
  - a. Find the potential common transcription factor binding site clusters that could be responsible for the co-expression.
  - b. Find additional genome-wide targets for the signature cis-regulatory modules identified by CisMols (*Hint*: use the feature ConciseScanner to find genome-wide additional targets for the shared cis-cluster obtained through CisMols analyzer).
- 4. Use PolyDoms applications for the following:
  - a. Using one of the gene lists from Appendix 2, annotate all the coding SNPs and find out what SNPs you would consider for designing a diagnostic chip or recommending for re-sequencing?
  - b. What coding SNPs are potentially deleterious for the apoptosis pathway?
  - c. How many proteins are involved in the DNA repair and how many of these have at least one coding nsSNP that occurs in a functional domain and is predicted as deleterious/damaging?

- 5. Using gene list 2 from (1) above, find out with which other differentially expressed gene lists do they overlap (use MSigDB Annotation or L2L or ToppGene). Are there any gene expression profiling studies where in these genes are down- or up-regulated?
- 6. Using gene list 1 from (1) above, obtain the mouse orthologs. For the mouse orthologs, download the 3'UTR sequences.

# APPENDIX 1: Other Useful bioinformatics resources and tools

- 1. Bioinformatics Resources: http://anil.cchmc.org
- 2. Sequence Manipulation Suite: http://anil.chmcc.org/sms/
- 3. RepeatMasker: To mask the repeat elements in a genomic sequence. http://www.repeatmasker.org/
- 4. PipMaker: To compute alignments of similar regions in DNA sequences. http://www.bx.psu.edu/
- 5. Exon Mapper: http://pbil.univ-lyon1.fr/sim4.php

# **APPENDIX 2: Co-expressed gene lists**

1: Nitric Oxide. 2002 Nov;7(3):165-86.

A DNA microarray study of nitric oxide-induced genes in mouse hepatocytes: implications for hepatic heme oxygenase-1 expression in ischemia/reperfusion. Zamora R, Vodovotz Y, Aulak KS, Kim PK, Kane JM 3rd, Alarcon L, Stuehr DJ, Billiar TR.

**#NAME** inos_10_dn #DESCRIPTION Ten most-downregulated genes following iNOS induction in hepatocytes #GENES: CD151, EIF5A, EEF2, CD81, PKM2, ACT6

**#NAME** inos_10_up #DESCRIPTION Ten most-upregulated genes following iNOS induction in hepatocytes #GENES: EED, CSRP1, PCNA, HMOX1, MCM2, CDK2, MCM6, GNB1, TUBB1

2: J Nutr. 2004 Apr;134(4):762-70.

Gene expression profiling in human preadipocytes and adipocytes by microarray analysis. Urs S, Smith C, Campbell B, Saxton AM, Taylor J, Zhang B, Snoddy J, Jones Voy B, Moustaid-Moussa N.

**#NAME** adip_human_dn

#DESCRIPTION Down-regulated in primary human adipocytes, versus preadipocytes #GENES: PPARD, CEBPA, MMP2, SNN, SPARC, COL5A1, DCN, COL3A1, LRP3, COL6A3, PSG9, ATRAP, CD37, ROM1, COL4A2, LUM, PPP2R1A, LRP5, LOX, PTPRN, OKL38, IL18BP, THBS4, FN1, THBS1, LOXL1, COL6A1, ADORA1, MMP9, PPARBP, E2F4, PTGDS, THBS2

**#NAME** adip_human_up

#DESCRIPTION Up-regulated in primary human adipocytes, versus preadipocytes
#GENES: PFKFB3, ABCE1, PLCD1, AGTRL1, CROC4, HSD11B2, AGT, FABP4,
DGKG, PTPN21, PTPRZ1, SCD, FABP5, RXRA, SMARCB1, COL1A2, CRYAB, DGAT1,
ZNF336, LRP8, CTSG, 3-PAP, APM1, DPT, CAP2, IL22R, SCAP1, USP8, LYPLA1,
HPCA, STAT5B, CYB5, E2F5, ALDH6A1, MMP7, LBP, GPD1, GLUL, GPX3, INSR,
FXYD1, FACL2, ALDH1A2, MGST1, MAP4K3, MASP1, ECM2, PTPRS, CEBPD,
KCNH2, ATP2B2, ACOX3, SPTBN4, TNFAIP2, LIPE, VN, FABP7, UCP4, LPL, ADFP,
PPAR- , E2F1, IGFBP2, CHST1, GDF8, ADORA2B, ATP8A2, ATIP1, LIPC, REQ, PLEK,
APOB, TAP1, AMT, PLIN, TFCP2, RXRB

3: Science. 2000 Mar 31;287(5462):2486-92. Mitotic misregulation and human aging. Ly DH, Lockhart DJ, Lerner RA, Schultz PG.

**#NAME** middleage_dn

#DESCRIPTION Downregulated in fibroblasts from middle-age individuals, compared to young

**#GENES:** CCNB, PLK, FOXM1, KIF11, PTGS2, KIF2C, CENPA, CDC20, H2AFX, KIF23, HMGN2, UBE2C, CCNF, CCNA, CENPF, MYB

**#NAME** middleage_up

#DESCRIPTION Upregulated in fibroblasts from middle-age individuals, compared to young #GENES: COL15A1, TNFRSF11B, SERPINB2, COL6A2, IL8, FMOD, MMP12, DPT,

CST6, COMP, THBS2, PTGS1, CRYBB2, MMP10, PRSS11

4: Oncogene. 2001 Jun 21;20(28):3674-82.

Distinctive gene expression profiles associated with Hepatitis B virus x protein. Wu CG, Salvay DM, Forgues M, Valerie K, Farnsworth J, Markin RS, Wang XW.

#NAME hbx_dn
#DESCRIPTION Downregulated by expression of Hepatitis HBx protein in hepatocytes
#GENES: CD4, GSTA4, GLG1, WT1, TGFB1, MAP3K1, IL6, APR-3, TP53, CDKN1A,
GSTM5, APC, GAS6

**#NAME** hbx_up #DESCRIPTION Upregulated by expression of Hepatitis HBx protein in hepatocytes **#GENES:** CCNI, DAD1, GSTM4, AP4B1, CDK4, TYMS, TNFRSF6, MYC, CCND3, PDCD2, PTK9, AP4S1, IGF1R, BCL2L1, TUBG1, TUBA4, TUBG2, VCL, IFNGR1, SLC5A1, MFNG, IFNAR2, CASP4, AP4E1, CDKN3

5: Nat Rev Cancer. 2002 Jan;2(1):38-47. Hypoxia--a key regulatory factor in tumour growth. Harris AL.

**#NAME** hypoxia_review

#DESCRIPTION Genes known to be induced by hypoxia
#GENES: EDN1, PFKP, MMP13, HSF, AK3, BIK, TGM2, P4HA, TEK, CDKN1B, SLC2A3, TF, CCNG2, CD99, SAT, FTL, PFKL, BNIP3, TH, RP1, STC1, HIF2A, PDGFB, VIM, IL8, LDHA, SPP1, CA9, PTGS2, PRPS1, BHLHB2, HK1, IGFBP2, TGFB1, APEX1, TFRC, ALDOA, CCL2, CA12, IL6, SLC2A1, ANGPT2, ACAT, L1CAM, TAGLN, HMOX1, FLT1, ANXA, TGFB3, PGF, IGF2, VEGF, IGFBP1, DDIT3, FOS, LRP8, ENPEP, HK2, G22P1, NOS, ADRA, HIF1A, TGFA, ENO1, PKM2, FGF3, HDAC, CDKN1A, ITGA, BNIP3L, ADM, XRCC5, EDN2, MIF, NFKB1, SERPINE, TXN, IGFBP3, COL5A1, F3, JUN, GAPD, PLAUR, TFF3, EPO, CP, HGF, PGK1

6: Science. 1999 Aug 27;285(5432):1390-3. Gene expression profile of aging and its retardation by caloric restriction. Lee CK, Klopp RG, Weindruch R, Prolla TA.

**#NAME** aged_mouse_muscle_dn

#DESCRIPTION Downregulated in the gastrocnemius muscle of aged adult mice (30month) vs. young adult (5-month) **#GENES:** IL6ST, CALM3, SIN3A, GFER, USP4, ABCB4, COL1A2, PRKCSH, PTPRR, POLA2, PLA2G7, HNRPD, COL1A1, PPP1R2, PRSS15, CLTB, FDFT1, PMP22, PSMB8, MYH2, TST, BMP8B, ADAM28, SRPR, PSMC3, CDC2L2, PPP3CC, S100A10, RAI2, NR2F1, PHOX2A, WNT4

**#NAME** aged_mouse_muscle_up

#DESCRIPTION Upregulated in the gastrocnemius muscle of aged adult mice (30-month) vs. young adult (5-month)

**#GENES:** GDF9, ARF5, MFAP5, HSPA6, HSPB1, ETV4, TFAP2B, ISLR, GADD45A, CKMT2, USP53, ATF3, ACTR1B, PBEF1, RAB1A, DCTN1, STARD7, DDX5, TM4SF3, U2AF2, SOX17, RAB21, AP3S2, CDC42, PLAGL1, AMY2B, PRSS11, ZFP90, POU3F2, HINT1, TGFB111, TGIF, ARHGDIB

# **APPENDIX 3: Querying NCBI - Example**

# Querying the NCBI's Entrez Gene:

For each of these, you can use the "Limits" also.

Purpose	Query	Explanation
find genes mapped to <i>Mus</i> <i>musculus</i> chromosome 16 that have orthologs reported in HomoloGene	Mus musculus[orgn] AND 16[chr] AND gene_homologene[filter]	<ul> <li>[orgn] is used to restrict to mouse (<i>Mus musculus</i>) to the organism field. Alternatively, you can use the "Limits" form to select mouse only.</li> <li>[chr] is used to restrict '16' to the chromosome field</li> <li>gene homologene[filter] is used to restrict records to those processed by HomoloGene.</li> </ul>
Find genes mapped to human chromosome 16 that have orthologs reported in HomoloGene and also have an OMIM record associated	16[chr] AND gene_homologene[filter] AND gene_OMIM[filter] AND "Homo sapiens"[orgn]	• Same as previous but an additional filter (OMIM) is used.
find all genes in the NCBI database that are derived from genomes other than mammals and are classified by Gene Ontology to have some association to DNA repair	"dna repair"[go] NOT mammalia[orgn]	<ul> <li>[go] is used to restrict to the field 'Genome Ontology'</li> <li>Quotes ("dna repair") are necessary to treat the two words (dna and repair) together</li> <li>[orgn] is used to restrict (as the boolean NOT) to species not classified as</li> </ul>

mammals.
----------

#### Querying the NCBI's OMIM:

- 1. What human genes are related to diabetes? Which of those genes are on chromosome 1?
  - i. enter: diabetes in the search box
  - ii. select Limits
  - iii. check the box for chromosome 1
  - iv. press Go

<u>OR</u> enter the following query in the search box and it will return the same results: diabetes [All Fields] AND 1[chr]

Note that some of the records retrieved will mention hypertension as part of the text of an entry, rather than in the title. That is because Entrez searches All Fields of a record by default. If you would like to limit retrieval only to records that contain the term diabetes in the Title Word field, check the "Search in Field" box for "Title" on the Limits page, in addition to checking the box for Chromosome 1. The query then would be diabetes [Title] AND 1[chr]

2. List the OMIM entries that describe genes on chromosome 21 and additionally each of which have a clinical synopsis also.

You can do this search in any of these two ways:

- i. Use the Limits page:
  - a. From the OMIM home page, select the Limits option under the search box.
  - b. check the box for chromosome 21.
  - c. Check the box for "clinical synopsis" under the section "Only Records With".
  - d. Press Go.
- ii. Enter the search as a command:
  - a. On the OMIM home page, enter the following in the search box:
  - b. 21[chr] AND "Clinical Synopsis"[prop]
  - c. Press Go.
